AI Ethics in College

Aggies don't lie, cheat, steal, or tolerate those who do.

A. Correct Use of AI in College

Using AI correctly in college means treating it as a tutor and study partner, not as a replacement for my own effort. I can ask AI to explain a difficult concept in simpler words, help me brainstorm topics, check my grammar, or quiz me before an exam. The key is that the ideas, the writing, and the final answers must still come from me, and I should be able to explain my work without the tool. Before I use AI on any assignment, I need to read the syllabus and follow my professor's rules about what is allowed. When AI helps me, I should be honest and clearly cite which tool I used and how I used it. I should also double-check what AI tells me, because it can be wrong or make up facts. Used this way, AI saves time and helps me learn faster. It also lets me keep my integrity and honor the Aggie Honor Code.

AI Response: Does AI agree? (Claude, Anthropic AI, October 29, 2026)

Yes, I agree with your paragraph. Treating AI as a tutor rather than a substitute is the healthiest approach, because it keeps the thinking and the learning with you. Your points about following the professor's rules, citing the tool, and verifying AI output are all important and match what most universities ask of students. One suggestion is to be more specific about where the line is: brainstorming and explaining concepts are usually fine, but submitting AI-written text as your own is not. A good test is whether you could explain and defend every part of the work in your own words. I would also add that rules differ from class to class, so when a policy is unclear, asking the instructor first is the safest choice.

B. Incorrect Use of AI in College

Using AI incorrectly in college means letting it do the work that I am supposed to do myself. Pasting an assignment into a chatbot and turning in the answer as my own writing is cheating, even if I change a few words. It is also wrong to use AI during a quiz or exam when outside help is not allowed. Hiding my AI use, or refusing to cite it when my professor requires it, is dishonest. Trusting AI without checking can lead me to submit false facts or fake sources. Beyond the risk of a failing grade or an honor code violation, misusing AI robs me of the practice that builds real skills. Employers expect graduates to think critically and solve problems on their own. Taking shortcuts now only hurts me later, and it goes against the Aggie core value of integrity.

AI Response: Does AI agree? (Claude, Anthropic AI, October 29, 2026)

Yes, I agree with your paragraph. The examples you chose, such as submitting AI-written work as your own, using AI on exams where it is banned, and hiding AI use, are the most common

ways students cross the line into academic misconduct. I especially agree with your point that the biggest cost is lost learning, not only the penalty, since skills such as writing and problem solving are what you are paying to develop. You could strengthen the paragraph by noting that changing a few words does not make copied AI text original, which you already hint at, and by mentioning that AI detectors are unreliable, so honesty matters more than avoiding detection. Your closing connection to integrity ties the argument together well.

AI Use Disclosure

Claude (Anthropic AI) was used on October 29, 2026 to evaluate the two paragraphs above and to generate the AI responses shown in this document.
